

Rockies Glaciers Are So Cool!

People have been adventuring, working, running businesses, conducting scientific research, and creating art on and around western Canada's glaciers for more than a century.

From the Philadelphia's Vaux family who launched North America's first glaciology studies in Canada's Glacier National Park in 1887, to the state-of-the-art research that continues to make new scientific discoveries,

western Canada's icefields and glaciers are fascinating, fun, mysterious, beautiful and, occasionally, dangerous places to explore, learn from and celebrate.

Over three decades of alpine adventures, **Lynn Martel** has explored the glaciers of her backyard Canadian Rockies. She's skied through whiteouts on massive icefields and climbed up steep icefalls riddled with crevasses. She's tented at 10,000 feet in minus 30 temperatures on the Columbia Icefield and forded turbulent melt-water creeks. And she's hiked across thousand-year-old ice with her camera to learn alongside some of the world's most respected glacier scientists.

Join Lynn for an unforgettable adventure as she shares stunning photographs and engaging stories about the mountaineers who pursue adventure, the scientists who seek knowledge, the professional guides who earn their living and the photographers and artists who all contribute to bringing the glaciers of the Canadian Rockies to dynamic, exciting and unforgettable life.
